

VENTILATOR FINAL PROJECT TEAM RED

5/8/20

1.

INTRODUCTION

Motivation and past work

Goals and Organization

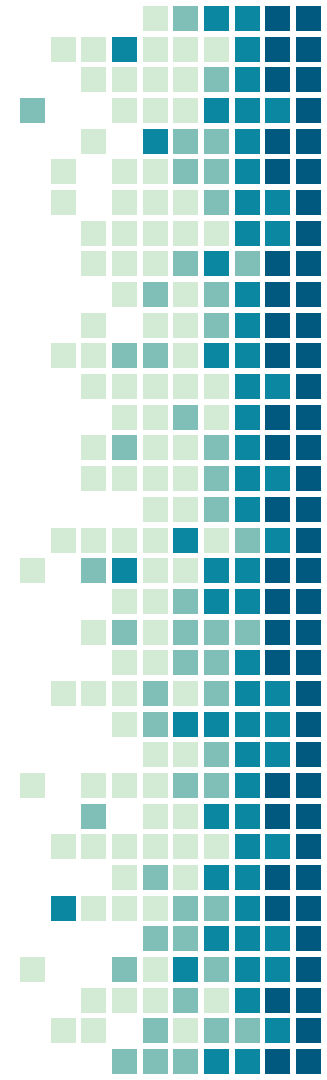

- Goals
 - Simple, low-cost
 - Hardware & software prototypes
- Subsystems
 - Design & Build
 - Controls & Lung Simulation
 - User Interface

Ventilator Basics

- Inspiration / Exhalation
- Valves to control the flow
- Sensors
- Control System
- Modes of operation
 - Volume Control
 - Pressure Control

$$P(t) = R \cdot f(t) + \frac{1}{C} \int_0^t f(t') dt'$$

2.

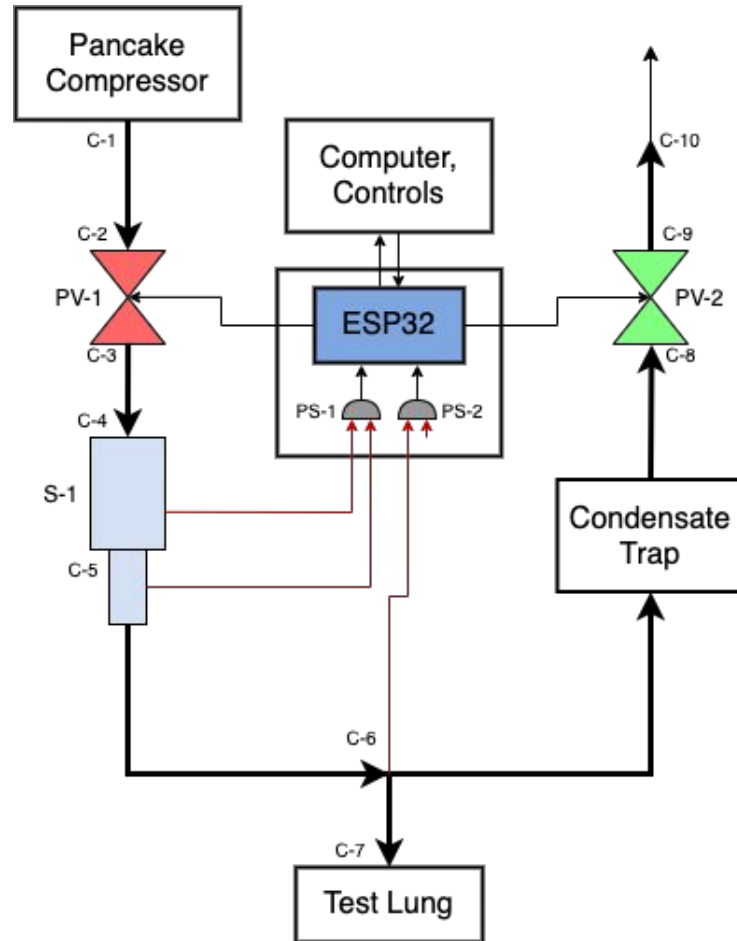

DESIGN AND BUILD

Schematic and physical prototype

Ventilator Design

- MVM inspired
- Sensors:
 - Pressure Sensor
 - Venturi Spirometer
- Actuators
 - Proportional-Control Valves
- ESP32 Controller

Goal: Low Cost

(1) Venturi Spirometer

(2) Servo Controlled Valves

(3) ESP32 Microcontroller

Cost of Build

- Our Build: \$181
 - Fittings: \$22
 - Tubing: \$30
 - Servo Valves (x2): \$55
 - Pressure Sensors (x2): \$64
 - ESP32: \$10
- MVM Design: *"hundreds of Euros"*
- Professional off-the-shelf ventilator: ~\$30,000

Future work

1. Protect Patients (Ventilator Associated Pneumonia)
2. Protect Healthcare Workers

Blender

O₂ and medical AIR (FiO₂)
protects against hypoxemia

Filter

HEPA Certified - protects
patient and environment

Humidifier

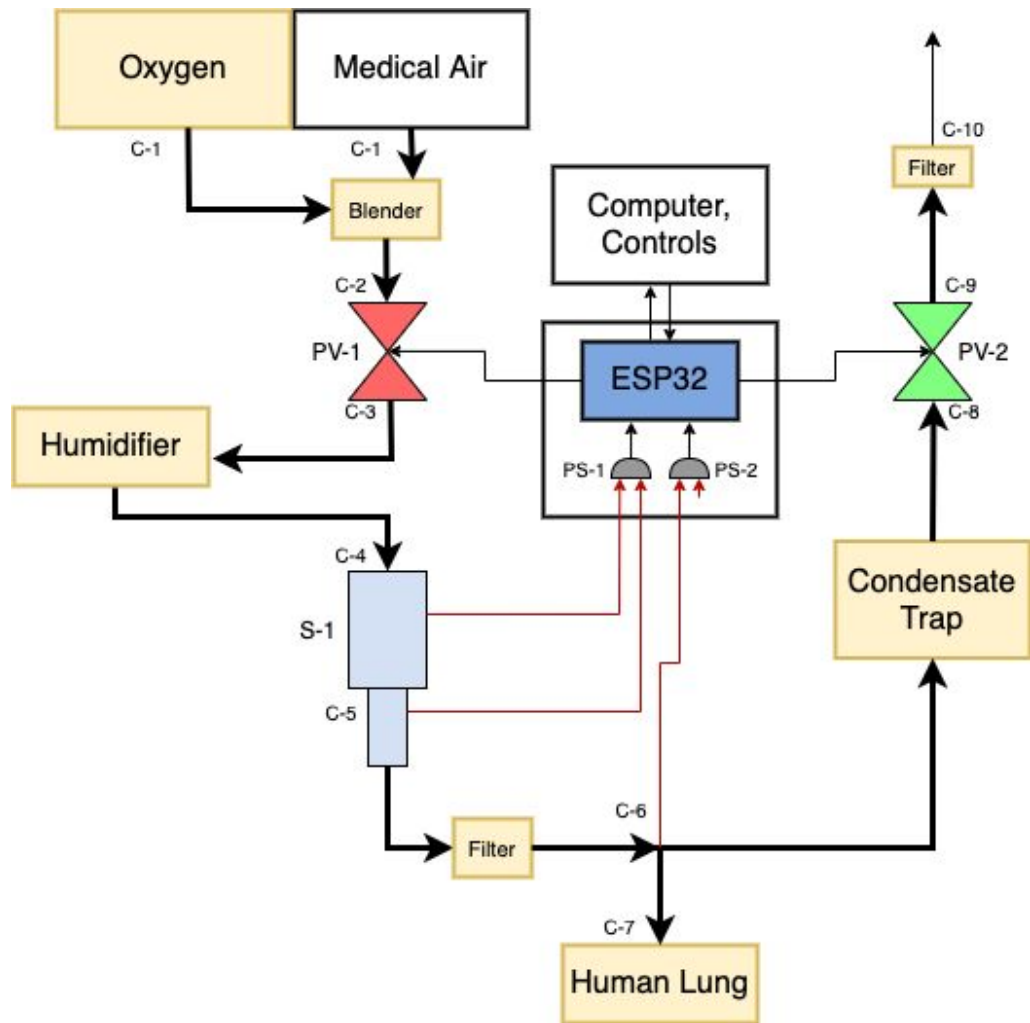

Moisture to improve
comfort & compliance

Condensate Trap

Prevents moisture from
harming system

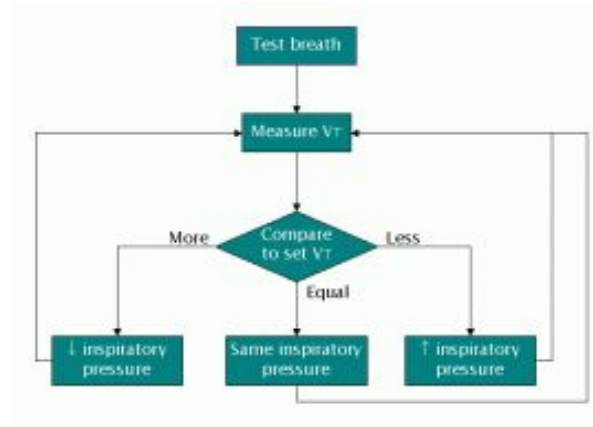

3. CONTROLS/LUNG SIMULATION

Motivation

- Delay in parts order → lung simulation idea
 - Emulate a lung through software
 - Implement controls in tandem with lung simulation
- Pressure Regulated Volume Control (PRVC)

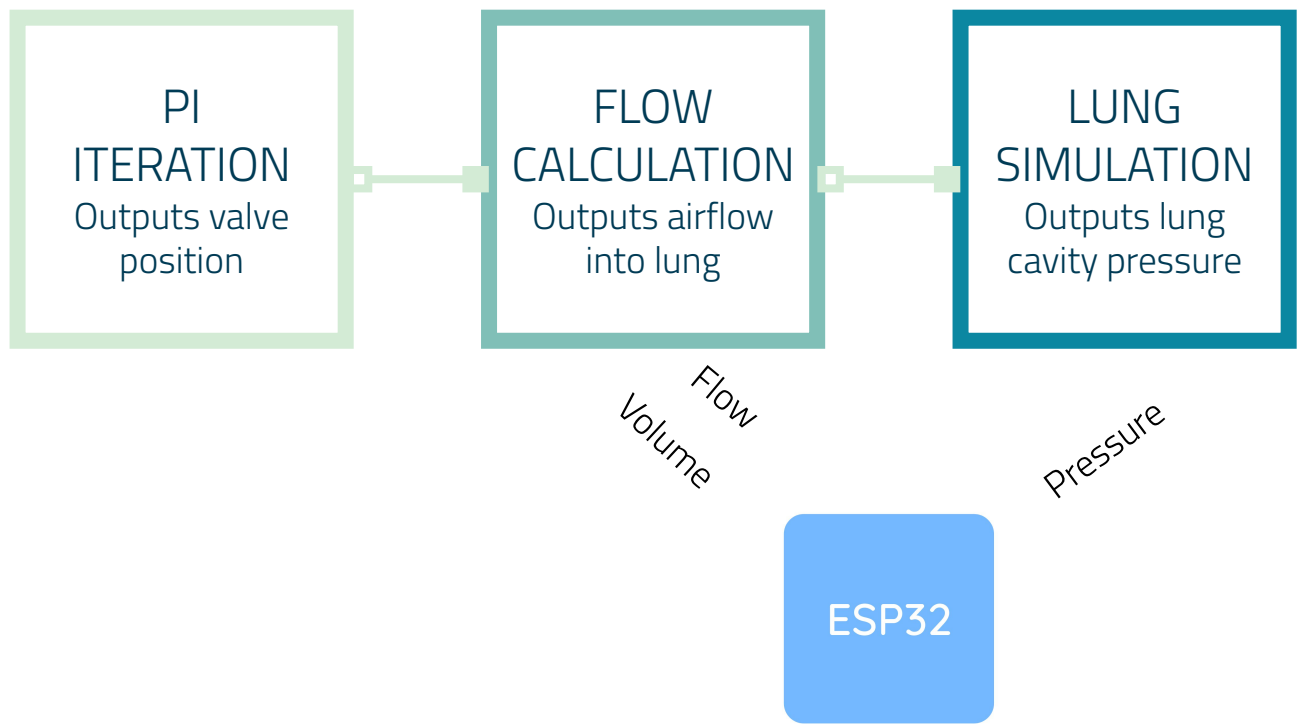

Design:

1. Replicate mandatory ventilation mode
 - a. Force breath into patient
 - b. Fixed number of breaths + timing of breaths
2. Single cavity fixed airway resistance of lung
 - a. Simple model for proof of concept
 - b. $P_m = \text{Volume}/\text{Compliance} + R \cdot \text{Flow}$
3. Integrate with UI

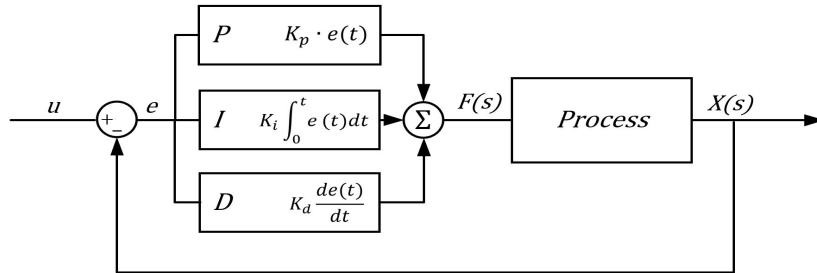

Simulation

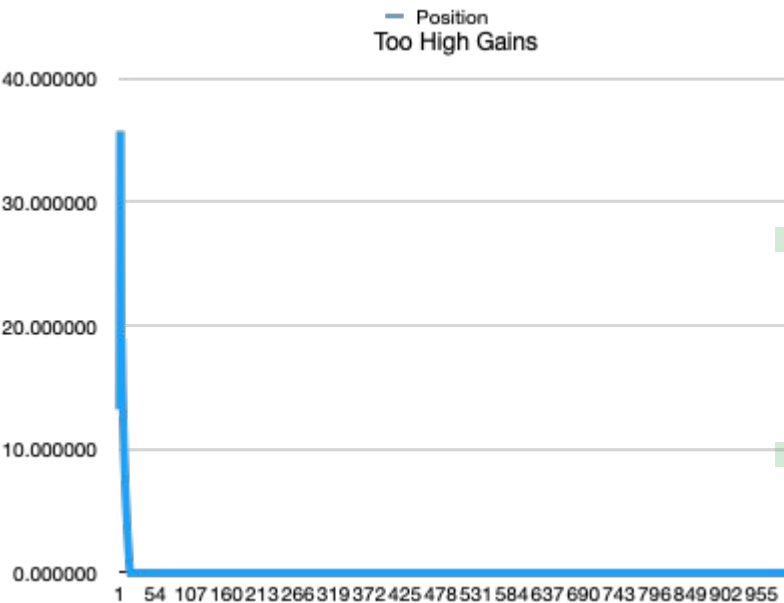

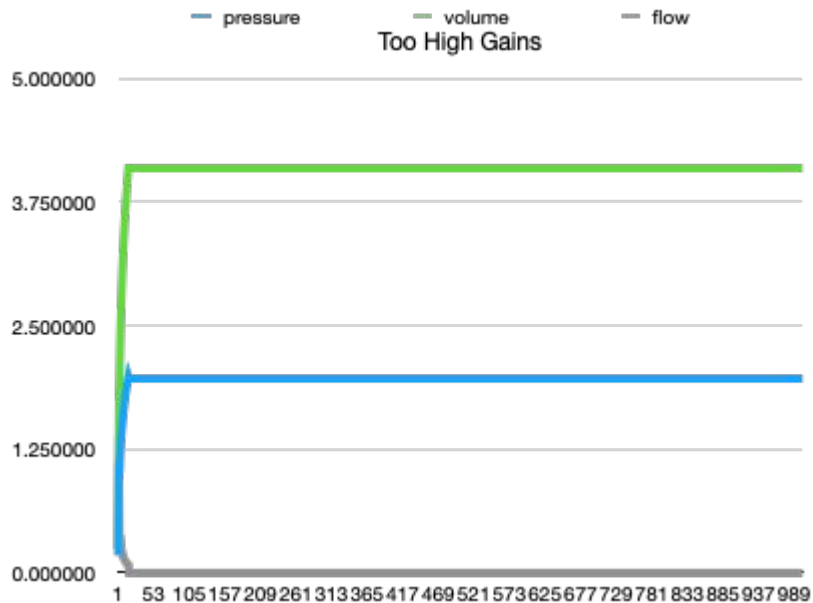

Feedback Controllers

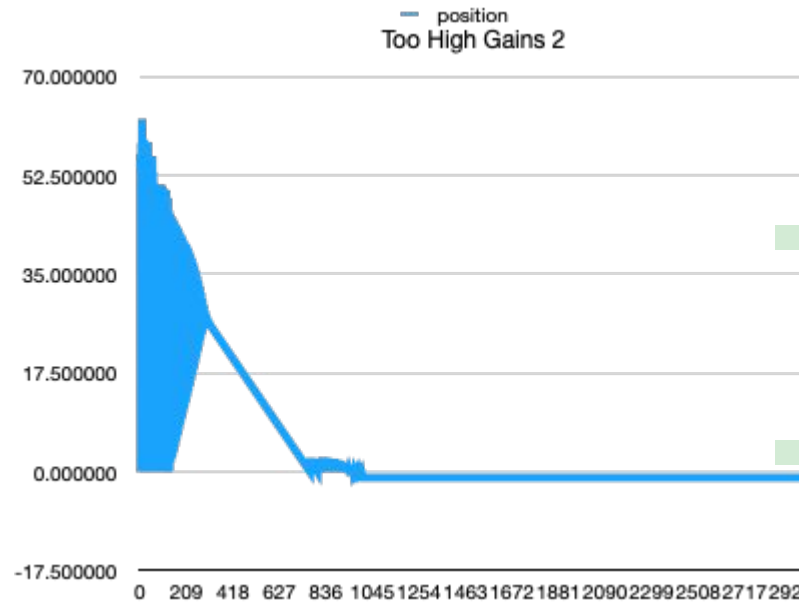

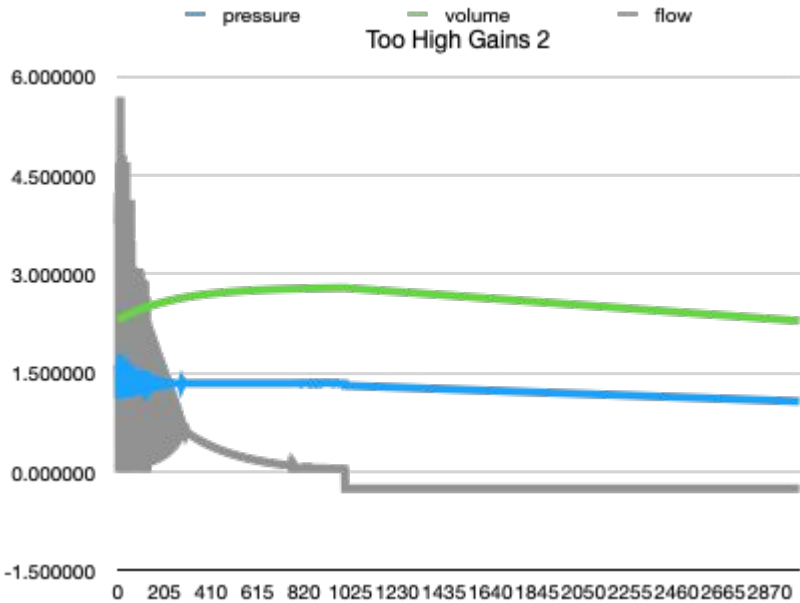

- Self-designed PI controller (similar to speed control) for simulation control
- Proportional controller for regulating pressure setpoint
- Iterative process to tune gains (k_p, k_i, k_d)
 - Reduce oscillatory behavior
 - Achieve setpoints in a reliable fashion

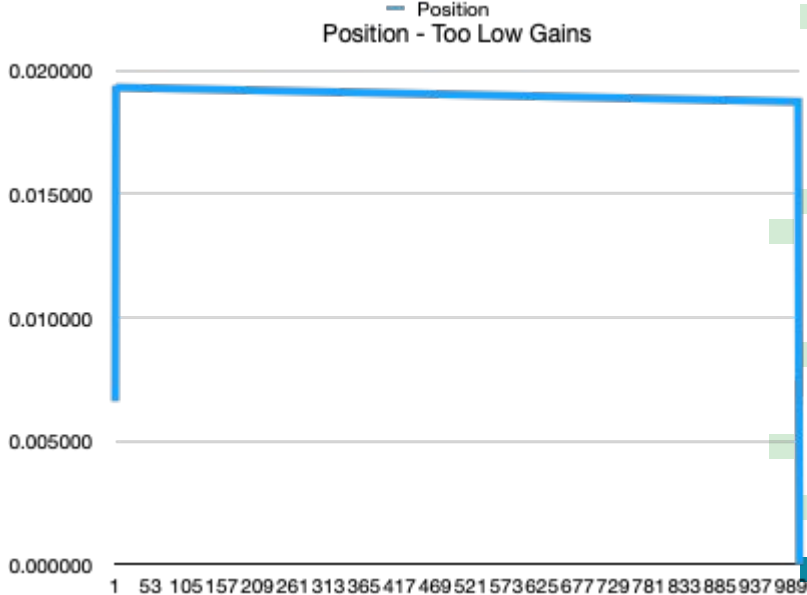

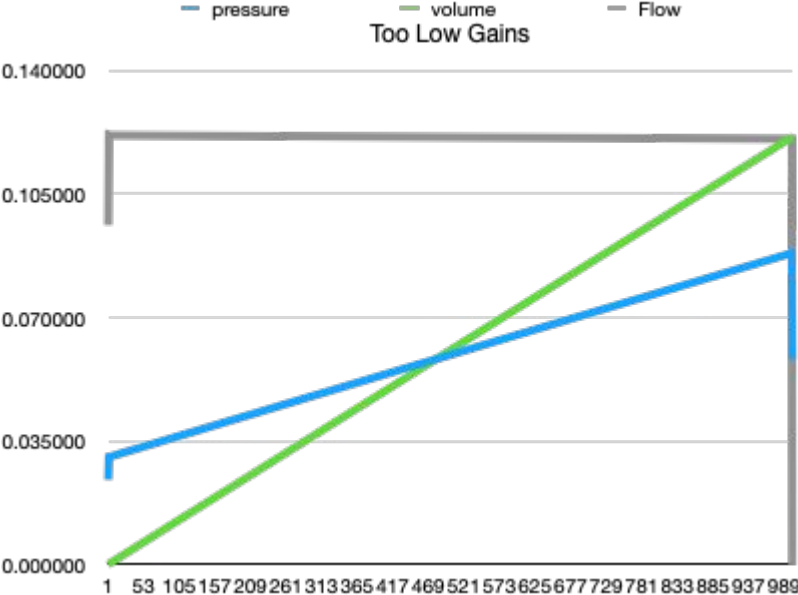

Results - High Gains

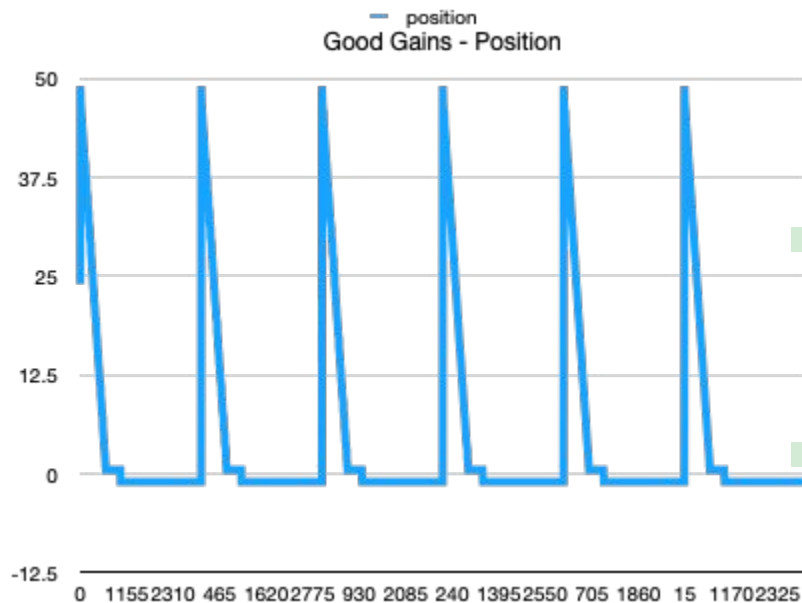

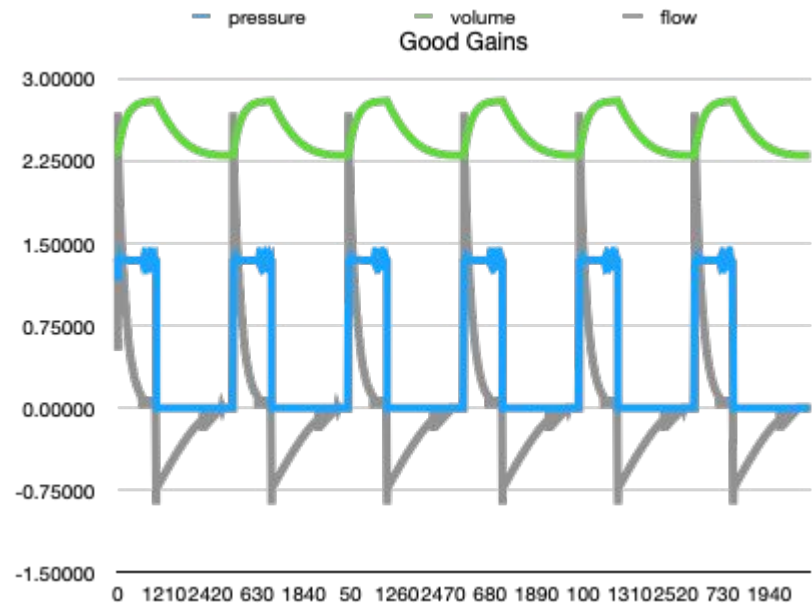

Results - Too High Gains 2

Results - Too Low Gains

Results - Good Gains

4.

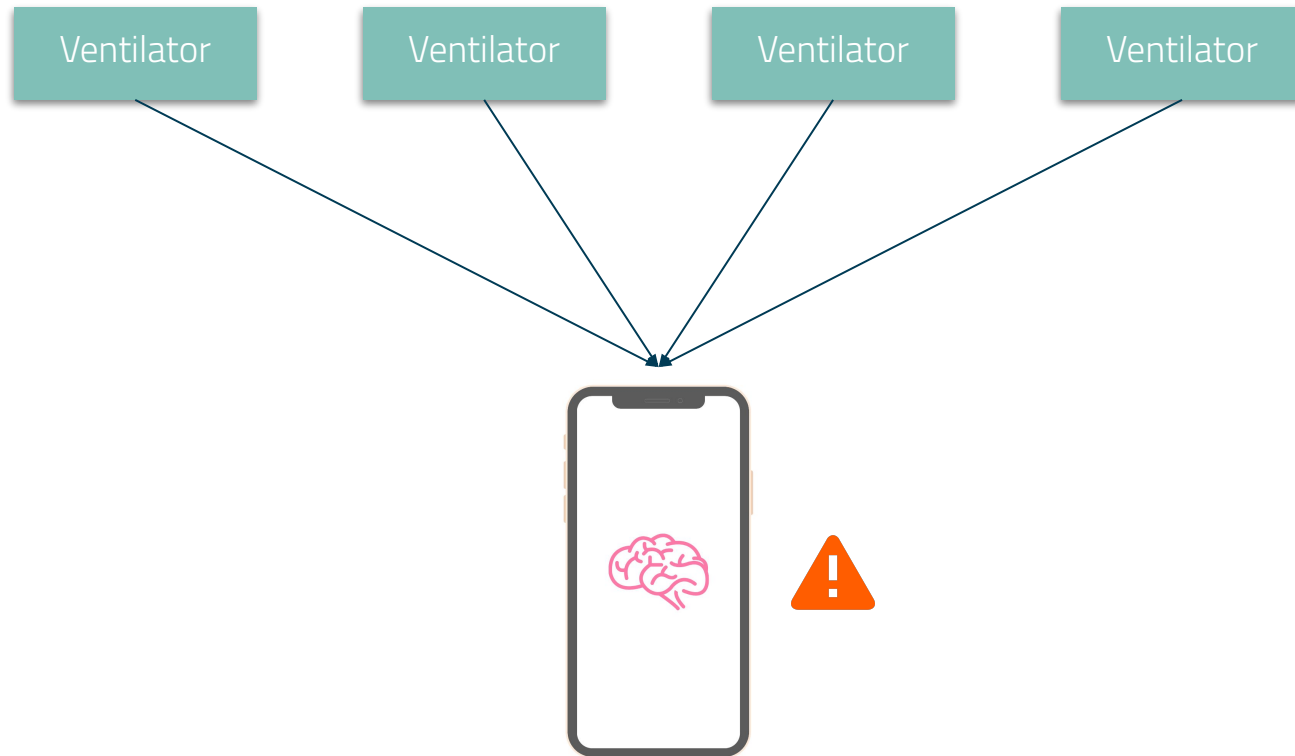

USER INTERFACE

Vision

Goal

Design

Implementation

VTi(ml)
499.89

PEEP(CmH2O)

Resp. Rate(b/min)

Tidal Volume(ml)

Conclusion and Future Steps

- Conclusion
 - Ventilator build, valves
 - Tuned PID controls
 - Pressure sensor & UI
 - Integrated controls, lung simulation, UI
- Future steps
 - Integrate & tune build, sensor, controls, UI
 - Additional parts, functionality

THANK YOU!

Thank you to Professor Thompson,
Professor Hodges, and Radd for all their
help and support with this project!
